## 1 Dataset Details

The MNIST(Modified National Institute of Standards and Technology) dataset contains images of handwritten digits from 0-9. It has 60,000 images for training and 10,000 images for testing.

Note:In this assignment I have used 10,000 images for training.

## 2 Visualisation of the Weights

### 3 Activations Visualisation

#### 3.1 Image Chosen

Figure 1: Image with number 4 in it

### 3.2 Activations

Figure 2: Activations

The activation map in 2nd Column and 3rd Row detects the vertical lines. And the activation map in the 4th Column and 3rd Row detects the horizontal lines. Also the activations hallucinate number 4. i.e we can see the number 4 in the weights. If we input any other number even then we can actually see that number (loosely) in the weights. Thus different weights activate for different numbers and that is how the Convolutional Neural Network distinguishes between different numbers after training.

## 4 Changing hyperparameters

### 4.1 Filter Size = 9 and Number of Filters = 20

Number of Epochs	Accuracy (%)
1	89.25
2	92.97
3	93.4
5	93.4
7	93.11
9	92.2

### 4.2 Filter Size = 9 and Number of Epochs = 3

Number of Filters	Accuracy (%)
10	93.57
15	94.04
20	93.4
25	92.62

### 4.3 Number of Filters = 20 and Number of Epochs = 3

Filter Size	Accuracy (%)
7	93.29
9	95.4
15	95.79
25	96.19
